The subject matter of claim 1 does not appear to be novel or to involve an inventive step in view of document 1 or 2 cited in the ISR. Both documents 1 and 2 describe a linear motor in which (1) an armature is arranged in the center position between left and right guide rails, (2) a linear scale and a sensor are provided as a position detecting means.

The subject matter of claim 2 does not appear to be novel or to involve an inventive step in view of document 1 cited in the ISR. Document 1 describes, in addition, providing a table present position detecting means consisting of a hall sensor and magnets for selecting on the opposite side of the linear scale.

The subject matter of claim 3 does not appear to be novel or to involve an inventive step in view of document 2. Document 2 describes, in addition, that a plurality of fitting holes are formed in the bed to mount the base plate or the like.

The subject matters of claims 4 and 5 do not appear to involve an inventive step in view of document 1 or 2, and document 3 cited in the ISR. Document 3 describes converting position data and mechanical information into serial data to transport a servo control device, from a linear servo machine constituted by containing a linear scale.

The subject matter of claim 6 does not appear to involve an inventive step in view of document 1 or 2, and document 4 cited in the ISR. Document 4 describes that the position detecting means of the linear motor is the detecting means of an absolute system.
